## Lecture Summary - Module 1 <br> Switching Algebra and CMOS Logic Gates

## Learning Outcome: an ability to analyze and design CMOS logic gates

## Learning Objectives:

1-1. convert numbers from one base (radix) to another: $2,10,16$
1-2. define a binary variable
1-3. identify the theorems and postulates of switching algebra
1-4. describe the principle of duality
1-5. describe how to form a complement function
1-6. prove the equivalence of two Boolean expressions using perfect induction
1-7. describe the function and utility of basic electronic components (resistors, capacitors, diodes, MOSFETs)
1-8. define the switching threshold of a logic gate and identify the voltage ranges typically associated with a "logic high" and a "logic low"
1-9. define assertion level and describe the difference between a positive logic convention and a negative logic convention
1-10. describe the operation of basic logic gates (NOT, NAND, NOR) constructed using N- and P-channel MOSFETs and draw their circuit diagrams
1-11. define "fighting" among gate outputs wired together and describe its consequence
1-12. define logic gate fan-in and describe the basis for its practical limit
1-13. identify key information contained in a logic device data sheet
1-14. calculate the DC noise immunity margin of a logic circuit and describe the consequence of an insufficient margin
1-15. describe the consequences of a "non-ideal" voltage applied to a logic gate input
1-16. describe how unused ("spare") CMOS inputs should be terminated
1-17. describe the relationship between logic gate output voltage swing and current sourcing/sinking capability
1-18. describe the difference between "DC loads" and "CMOS loads"
1-19. calculate $\mathrm{V}_{\mathrm{OL}}$ and $\mathrm{V}_{\mathrm{OH}}$ of a logic gate based on the "on" resistance of the active device and the amount of current sourced/sunk by the gate output
1-20. calculate logic gate fan-out and identify a practical lower limit
1-21. calculate the value of current limiting resistor needed for driving an LED
1-22. describe the deleterious effects associated with loading a gate output beyond its rated specifications
$1-23$. define propagation delay and list the factors that contribute to it
1-24. define transition time and list the factors that contribute to it
1-25. estimate the transition time of a CMOS gate output based on the "on" resistance of the active device and the capacitive load
1-26. describe ways in which load capacitance can be minimized
$1-27$. identify sources of dynamic power dissipation
1-28. plot power dissipation of CMOS logic circuits as a function of operating frequency
1-29. plot power dissipation of CMOS logic circuits as a function of power supply voltage
1-30. describe the function and utility of decoupling capacitors
1-31. define hysteresis and describe the operation of Schmitt-trigger inputs
1-32. describe the operation and utility of a transmission gate
1-33. define high-impedance state and describe the operation of a tri-state buffer
1-34. define open drain as it applies to a CMOS logic gate output and calculate the value of pull-up resistor needed
1-35. describe how to create "wired logic" functions using open drain logic gates
1-36. calculate the value of pull-up resistor needed for an open drain logic gate

## Lecture Summary - Module 1-A

## Number Systems

Reference: Digital Design Principles and Practices ( ${ }^{\text {th }}$ Ed.), pp. 25-34

- overview
- $d_{n}$ - digits of base $R$ number
- $\mathbf{c}_{\mathbf{n}}$ - converted corresponding digits in base 10
$\circ$ dealing with unsigned numbers only at this point $\rightarrow$ leading zeroes don't matter
- table of correspondence

| $\mathbf{N}_{2}$ | $\mathbf{N}_{3}$ | $\mathbf{N}_{4}$ | $\mathbf{N}_{5}$ | $\mathbf{N}_{6}$ | $\mathbf{N}_{7}$ | $\mathbf{N}_{8}$ | $\mathbf{N}_{\mathbf{9}}$ | $\mathbf{N}_{10}$ | $\mathbf{N}_{16}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| 10 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 |
| 11 | 10 | 3 | 3 | 3 | 3 | 3 | 3 | 3 | 3 |

| 1101 | 111 | 31 | 23 | 21 | 16 | 15 | 14 | 13 | D |
| 1110 | 112 | 32 | 24 | 22 | 20 | 16 | 15 | 14 | E |
| 1111 | 120 | 33 | 30 | 23 | 21 | 17 | 16 | 15 | F |
| 10000 | 121 | 100 | 31 | 24 | 22 | 20 | 17 | 16 | 10 |

- integer conversion: base $\mathbf{R}$ to base 10
- method: iterative multiply and add
- based on nested expression of a number
- integer conversion: base 10 to base $\mathbf{R}$
- method: iterative division
- remainders become digits of converted number
- quotient of zero indicates conversion is complete

Example: Convert (727) ${ }_{10}$ to base 8

$$
\begin{aligned}
\left(d_{3} d_{2} d_{1} d_{0}\right)_{R} & =(N)_{10} \\
& =c_{3} \times R^{3}+c_{2} \times R^{2}+c_{1} \times R^{1}+c_{0} \times R^{0} \\
& =\left(\left(\left(c_{3} \times R+c_{2}\right) \times R+c_{1}\right) \times R+c_{0}\right)
\end{aligned}
$$

Example: Convert (4352) s $_{8}$ to base 10
$4 \times 8+3=35$
$35 \times 8+5=285$
$285 \times 8+2=2282$

$$
5+1-1
$$

Therefore, $(4352)_{8}=(2282)_{10}$

- short cut for conversion among powers of 2 (from base " $A$ " to base " $B$ ")
- method: size $\log _{2} R$ groupings
- write an n-digit binary number for each base A digit in the original number, where $\mathrm{n}=\log _{2} \mathrm{~A}$
- starting at the least significant position, form m-digit groups, where $\mathbf{m}=\log _{2} B$

Example: Convert (136) $)_{8}$ to base 2 and base 16

| 1 | 3 | 6 |
| :---: | :---: | :---: |
| 001 | 011 | 110 |
| 0101 |  | 1110 |
| 5 |  | $E$ |

Therefore, $(136)_{8}=(\underline{1011110})_{2}=(\underline{5 E})_{16}$

Exercise: Convert $(110101)_{2}$ to bases 8 and 16

| 6 | 5 |
| :---: | :---: |
| 110 | 101 |
| 110101 |  |
| 0011 | 0101 |
| 3 | 5 |

Therefore, $(110101)_{2}=(\underline{65})_{8}=(\underline{35})_{16}$
