

## Lecture 6

```
void f1(int a, int b)
```

```
{
```

```
    int c = a;
```

```
    a = 5;
```

```
    b = 3;
```

```
}
```

```
void f2(int a, int b)
```

```
{
```

```
    int d = 8.2;
```

```
    char e = 'p';
```

```
    f1(a+3, b-d);
```

```
}
```

```
int main(int argc, char* argv[])
```

```
{
```

```
    int a = 12;
```

```
    int b = -9;
```

```
    printf("%d %d \n", a, b);
```

```
    f2(a, b);
```

```
    printf("%d %d \n", a, b);
```

```
}
```

← Draw the stack at this point

- C does not have  
call by reference  
ONLY call by value.

What happens when a function is called at run time?

- gcc marks return address (immediately after the call) and stores (called "push") it on the call stack
- gcc stores the address for the return value
- gcc copies the values to the arguments, stored on the call stack
- gcc allocates space for variables, stored on the call stack
